

GEN3SIS SOLUTIONS

IT Strategy, Architecture & Governance

GovG360

What is GovG360?

GovG360 is Gen3sis' solution for defining and governing an organization's IT master plan, aligning strategy, architecture, risks, and technology governance with business objectives.

It allows IT to be transformed into a strategic enabler rather than a cost center by reducing TCO, controlling risks, and ensuring that every technology investment generates real value, under an Industry 5.0 approach, where artificial intelligence and human judgment work in a complementary manner.

The problem it solves

Many organizations have built their IT reactively: isolated projects, overlapping technologies, and tactical decisions without a comprehensive vision. This leads to high operating costs, security and compliance risks, low agility, and a constant disconnect between IT and business.

GovG360 eliminates this fragmentation by establishing a clear architecture and governance model that brings order, visibility, and control over technology.

What does the solution include?

- Definition of IT strategy and enterprise architecture
- IT governance model, policies, and operational standards
- Technology risk management and regulatory compliance
- Optimization of the portfolio of applications, services, and costs
- Prioritized technology roadmap (12–36 months)
- Metrics, KPIs, and executive tracking models

Key benefits

- Full alignment between IT and business objectives
- Reduction of TCO and optimization of technology investments
- Reduced exposure to operational, regulatory, and security risks

Next step

Is your IT ready to support business growth securely, efficiently, and sustainably? Let's talk and design together the IT master plan your organization needs.
